

Based on the previous levels of analysis, a profile was created to better understand the selected neighborhoods.

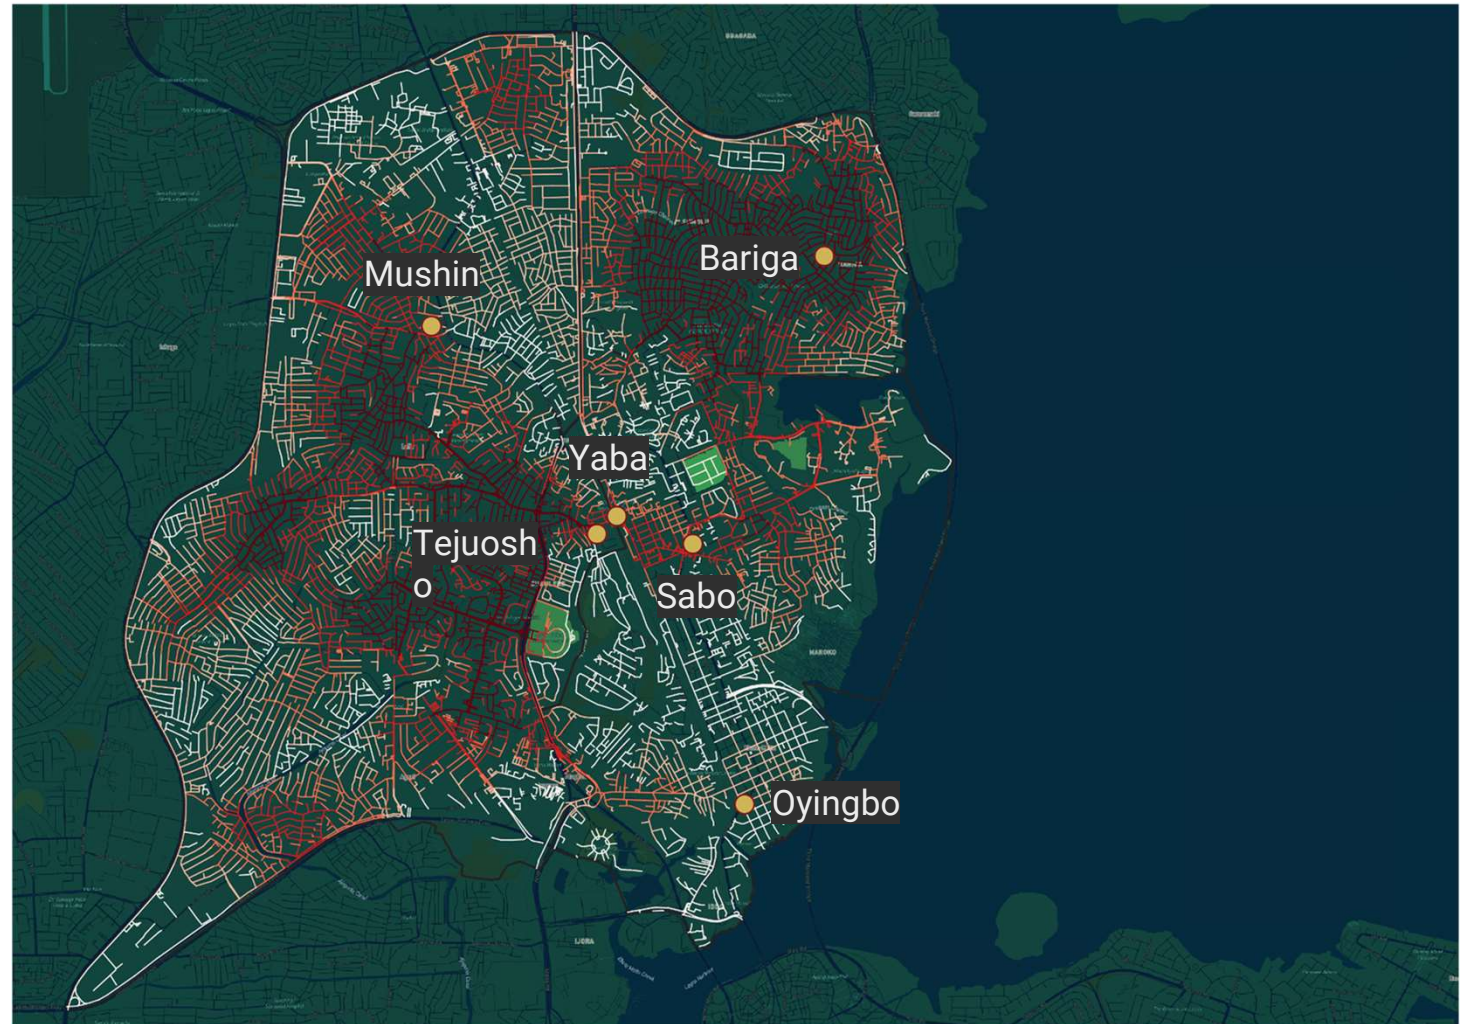

The Profiles were based on;

- GreenCover
- Built Up Density
- Spaces of Worship
- Police Coverage

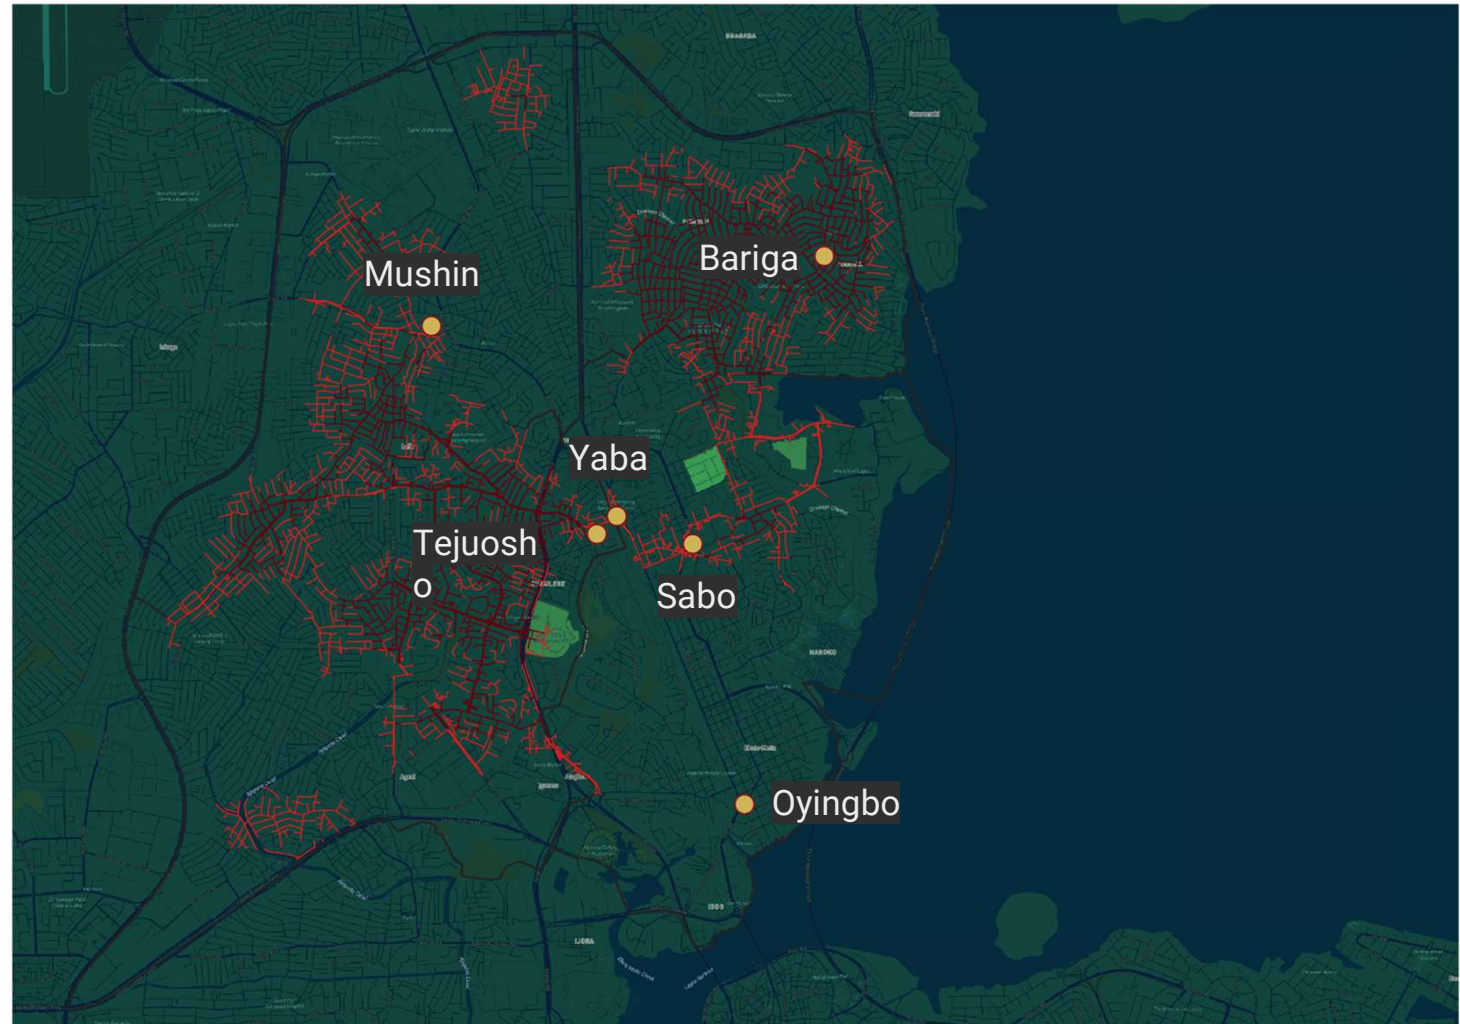

Angular Betweenness aims to analyse the network for the **least number of turns required to reach within a specified radius.**

This map thereby implies the **most common paths used with the least turns.** Implying efficient routes as well as more **visual safety**, as fewer blind corners

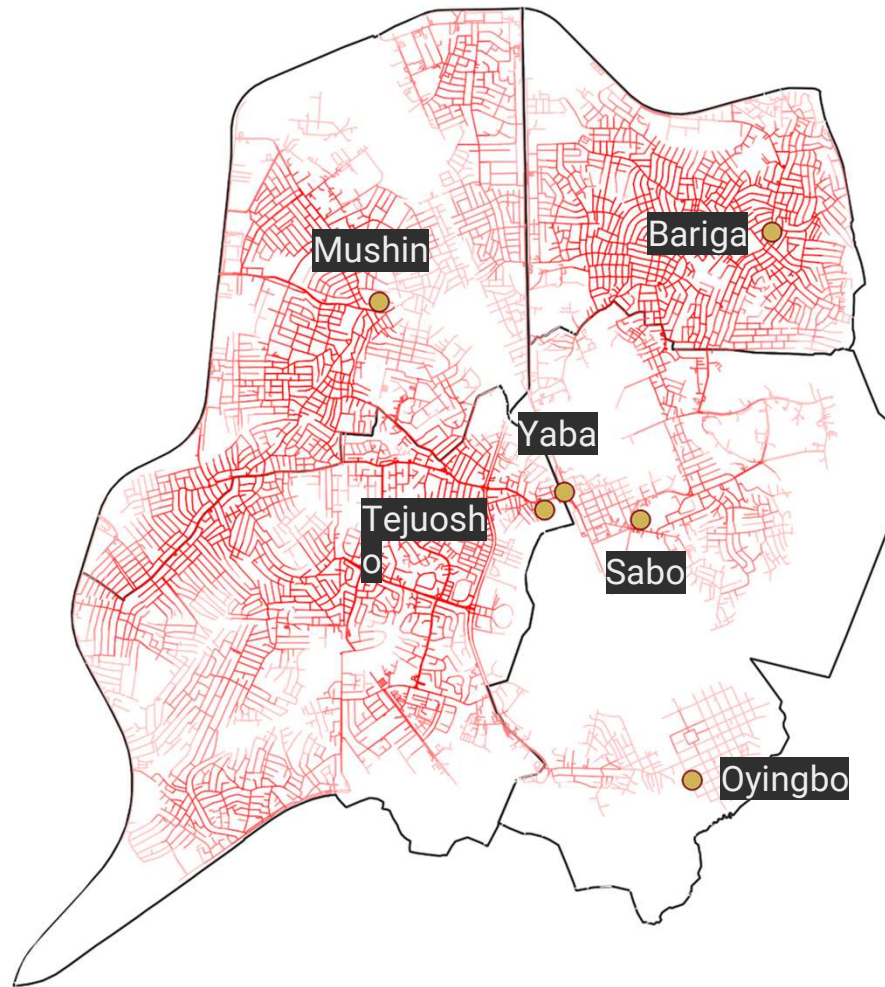

All the markets, excluding Oyingbo, fall within the paths that are most comfortable in terms of **angular comfort** and implies a certain factor of **safety**.

The Network 'Reach' analysis aims to see all the paths that are most accessible from a 1200m radius from other respective paths.

Within a 1200m radius of walking within the 4 neighborhoods, Tejuosho, Mushin and Yaba are very accessible.

This analysis works to analyse the effectiveness of the markets' locations; in the sense of its' proximity to the shortest paths that would be used within a 1200m radius.

Apart from Oyingbo, the others are located within close proximity to paths that would most likely be used in these neighborhoods
